Liu J., Okazaki K., Kida H.;
Submitted (JUN-2003) to the EMBL/GenBank/DDBJ databases.

-I- FUNCTION: Removes the terminal sialic acid from carbohydrate chains of the host cell surface proteins and from the viral envelope. Such a reaction prevents self-aggregation and faci the mobility of the virus to and from the site of infection

The invention relates to an isolated peptide (I) comprising at least two individual modules separated by 0-50 amino acids, with each containing at least one motif His-Pro-X where X = Gln, Asn or Met. (I) which contain streptavidin binding modules, are useful as affinity handles for purification of recombinant fusion proteins (FP), also for detecting FP, e.g. on protein chips or microcitire plates. The modules in (I) bind strongly to streptavidin, with a co-operative effect that provides stronger binding than a single tag, but are displaced by a competitor. (I) does not interfere with the function of attached proteins (II) (so it

New isolated peptide, useful as affinity purification tag for recombinant protein, comprises at least two high-affinity streptavidin-binding modules.

                                                                                                                                                                                                                                                  21-MAR-2001; 2001DE-01013776.
                                                                                                                                                                                                                                                                 21-MAR-2001; 2001DE-01013776
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   may not be essential to remove it); facilitates detection and has easily controllable binding properties. (I) is particularly used for purifying FP from dilute solution in batch formats (which use simpler apparatus than column methods and result in lower loss of FP). The present sequence is that of a streptavidin binding peptide disclosed with the invention
                                                                                                                                                                                                                                 (BIOA-) INST BIOANALYTIK GMBH

DE10113776-A1.

The invention relates to an isolated peptide (I) comprising at least two individual modules separated by 0-50 amino acids, with each containing at least one motif His-Pro-X where X = Gln, Asn or Met. (I), which contain Streptavidin binding modules, are useful as affinity handles for purification of recombinant fusion proteins (FP), also for detecting FP, Ce.g. on protein chips or microtitre plates. The modules in (I) bind Strongly to streptavidin, with a co-operative effect that provides Stronger binding than a single tag, but are displaced by a competitor. (I) does not interfere with the function of attached proteins (II) (so it may not be essential to remove it); facilitates detection and has easily controllable binding properties. (I) is particularly used for purifying FP from dilute solution in batch formats (which use simpler apparatus than column methods and result in lower loss of FP). The present sequence is that of a streptavidin binding peptide disclosed with the invention Sequence Disclosure; Page 4; 18pp; German New isolated peptide, useful as affinity purification tag for recombinant protein, comprises at least two high-affinity streptavidin-binding 24 AA,

Claim 8; Page 16; 18pp; German.

New isolated peptide, useful as affinity purification tag for recombinant protein, comprises at least two high-affinity streptavidin-binding

WPI; 2003-031166/03.

                                                                                                                                                       disintegrin-like and metalloprotease (reprolysin type) with thrombospondin type 1 motif 4) protein with improved stability compared thrombospondin type 1 motif 4) protein with improved stability compared to a naturally occurring, full-length ADAMTS4 protein, where the modified protein differs from the naturally-occurring, full-length ADAMTS4 protein by at least one amino acid. ADAMTS proteins are a subfamily of zinc metalloproteases and include aggrecanases amongst their members. The protein of the invention demonstrates osteopathic, antiinflammatory, antiarthritic, antirheumatic and cytostatic activities and may be useful for treating aggrecanase-associated conditions, including osteoarthritis, glioma, cancer, inflammatory joint disease, rheumatoid arthritis, septic arthritis, periodontal disease and Crohn's disease. The current sequence is that of a human aggrecanase modified ADAMTS4 (mTS4) protein of the

The invention relates to a novel isolated, modified ADAMTS4 (a disintegrin-like and metalloprotease (reprolysin type) with the compared of a naturally occurring, full-length ADAMTS4 (a protein differs from the naturally-occurring, full-length ADAMTS4 protein, where the modified by at least one amino acid. ADAMTS proteins are a subfamily of zinc protein of the invention demonstrates oserate a subfamily of zinc for treating aggreganase-associated conditions, antirheuric and cytostatic and cytostatic antirhial members. The carrier, inflammatory joint disease, rheumatoid archivitis, periodontal disease and Crohn's disease. The current sequence is that of the human aggreganase ADAMTS4 truncated protein with insert

The invention relates to human nucleic acids (AAIS7798-AAIS1369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, for imministypressant and cyrostatic acityity. The polypucleotides of the invention may be used to treat diseases of the polypucleotide of the invention may be used to treat diseases of the peripheral nervous injuries of the peripheral nervous acityities, peripheral nervous system diseases, buth as a partials and central nervous system diseases, such as a cartyinininhibin activity, chemotactic/chemotatheet also receptor activity, cancer disease, suppression, compared the peripheral nervous system disease, and strombolytic activity, chemotactic/chemotatheet assignment of the activity, cancer dispuses include the compared activity, cancer dispuses include the compared activity, cancer dispuses and therapy, drug screening, compared activity, arthritis and inflammation, leukaemias and the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                   23-DEC-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
The invention relates to a novel isolated, modified ADAMTS4 (a disintegrin-like and metalloprotease (reprolysin type) with thrombospondin type 1 motif 4) protein with improved stability compared to a naturally occurring, full-length ADAMTS4 protein, where the modified protein differs from the naturally-cocurring, full-length ADAMTS4 protein by at least one amino acid. ADAMTS proteins are a subfamily of zinc metalloproteases and include aggrecanases amongst their members. The
                                                                                                                                                                                                        Claim
                                                                                                                                                                                                                                             New isolated, modified ADAMTS4 (aggrecanase) protein with improved stability useful for identifying inhibitors of the enzyme activity for treating aggrecanase-associated conditions, including osteoarthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (CORC/)

The current sequence is that of the furin-processed human aggrecanase ADAMTS4 truncated protein with Strep tag of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                       New isolated, modified ADAMTS4 (aggrecanase) protein with improved stability useful for identifying inhibitors of the enzyme activity treating aggrecanase-associated conditions, including osteoarthriti

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             disintegrin-like and metalloprotease (reprolysin type) with thrombospondin type 1 motif 4) protein with improved stability compared to a naturally occurring, full-length ADAMTS4 protein, where the modified protein differs from the naturally-occurring, full-length ADAMTS4 protein by at least one amino acid. ADAMTS proteins are a subfamily of zinc metalloproteases and include aggrecanases amongst their members. The protein of the invention demonstrates osteopathic, antiinflammatory, antiarthritic, antirheumatic and cytostatic activities and may be useful for treating aggrecanase-associated conditions, including osteoarthritis, glioma, cancer, inflammatory joint disease, rheumatoid arthritis, septic arthritis, periodontal disease and Crohn's disease. The current sequence is that of the human aggrecanase ADAMTS4 truncated protein with Strep tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Choline-binding protein; CbpG; vaccine; immune response; antibacterial; CbpA.

                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to choline-binding protein (CbpG) and its corresponding nucleic acid. Vaccines that contain CbpG, its N-truncated version or nucleic acid encoding them are useful for preventing infection by bacteria that express CbpG, specifically Streptococcus pneumoniae and in inducing an immune response. Compositions that contain CbpG or antibodies specific for it are useful for treating such infections. Antibodies are also useful for diagnostic detection of CbpG and oligonucleotides that hybridise to CbpG DNA are used to detect CbpG-expressing bacteria. CbpG DNA are used for recombinant production of CbpG and their fragments. The present sequence is Pneumococcus sp. CbpA protein. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated streptococcal choline-binding protein CbpG, useful for treatment of streptococcal infections and in protective vaccines, also related nucleic acid and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 06-APR-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes novel polypeptides (I) that are muteins of bilin binding protein (BBP), which can bind digoxigenin (Dig) or its conjugates, do not bind ouabain, testosterone or 4-aminofluorescein, and have an amino acid (aa) substitution at at least one of the positions 28, 31, 34-37, 58, 60, 69, 88. 90, 95. 97, 114, 116, 125 or 127. (I), or its fusion proteins, are used to bind, detect, determine, immobilize or separate Dig or its conjugates with proteins, nucleic acids, carbohydrates, other biological or synthetic macromolecules or low molecular weight compounds, particularly in assays where Dig is being used as a label. Compared with Dig-specific antibodies, (I) have a simpler structure and are easier to prepare. They have very high specificity for Dig, relative to other steroids, and fusion partners may be attached to either end without compromising their ability to bind
                                                                                                                                                                                                                                                                                                    Murine antibody M1 Fab fragment heavy chain.
                                                                                                                                                                                                                                                                                                                                                                                         ADO19051 standard;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          analyte, comprising reacting a sample containing the analyte with a reagent pair comprising a first binding partner that binds to the analyte and a second binding partner that binds to the complex of the analyte and the first binding partner, and determining the binding of the second binding partner, and determining the binding of the second binding partner, thus indicating the presence of the analyte in the sample. The first and second binding partners are antibody fragments for a small analyte, particularly for assaying drugs of abuse e.g., morphine, THC or amphetamine. The immunoassay is useful for detecting environmental hazards, toxic compounds in food and feed, chemicals indicative of processes (e.g., microbial processes in buildings, metabolic processes of living organisms) and in clinical tests, drug monitoring and pharmacological research. This sequence represents the murine antibody M1 Fab fragment heavy chain, used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Non-competitive immunoassay for small analyte, useful for assaying drug of abuse (e.g., morphine), comprises reacting a sample of analyte with reagent pair comprising a first binding partner and a second binding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a non-competitive immunoassay for a small canalyte, comprising reacting a sample containing the analyte with a creagent pair comprising a first binding partner that binds to the analyte can a second binding partner that binds to the complex of the analyte and the first binding partner, and determining the binding of the second binding partner, and determining the binding of the second conding partner, thus indicating the presence of the analyte in the cample. The first and second binding partners are antibody fragments Fab cor serv. The reagent pair is useful in a non-competitive immunoassay for a small analyte, particularly for assaying drugs of abuse e.g., morphine, cor amphetamine. The immunoassay is useful for detecting environmental congoing processes (e.g., microbial processes in buildings, metabolic congoing processes (e.g., microbial processes in buildings, metabolic processes of living organisms) and in clinical tests, drug monitoring and pharmacological research. This sequence represents the murine antibody M2 corrections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

1:

The present invention relates to a new non-naturally occurring recombinant DNA molecule comprising a sequence encoding a chelon protein which binds mercuric ions. The invention is useful for recombinantly producing a protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding region for the protein to produce a recombinant host cell and culturing the recombinant host cell under conditions, where DNA is expressed. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC nucleic acid encoding the chelon protein is useful for binding divalent CC mercuric ions, to take up, sequester and concentrate the heavy metal ions CC from contaminated soil, ground water, hydroponic solutions or irrigation CC water of waste streams. The DNA of the invention, when immobilised onto a CC solid support, is useful for concentrating heavy metal ions from CC contaminated environment waste streams or contaminated aqueous medium CC including biological fluids. The nucleic acid, when recombinantly CC expressed in enteric bacteria (which are nontoxigenic and nonpathogenic), CC is suitable for use in the in vivo sequestration and elimination of CC mercuric ion from gastrointestinal tracts of animals or humans exposed to toxic metal ions such as mercury and/or cadmium. The molecules of the invention are also useful in water treatment resins. The nucleic acid of CC the invention is highly specific and binds divalent cation such as CC mercury or cadmium with high affinity. The present amino acid sequence condition mercury ion binding chelon proteins of the invention. This sequence is one of the heavy metal binding proteins termed chelons of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Best Loc

CC comprising a promoter active in the host cell operably linked to a coding CC region for the protein to produce a recombinant host cell and culturing CC the recombinant host cell under conditions, where DNA is expressed. The nucleic acid encoding the chelon protein is useful for binding divalent CC mercuric ions, to take up, sequester and concentrate the heavy metal ions CC from contaminated soil, ground water, hydroponic solutions or irrigation CC water of waste streams. The DNA of the invention, when immobilised onto a CC solid support, is useful for concentrating heavy metal ions from CC contaminated environment waste streams or contaminated aqueous medium CC including biological fluids. The nucleic acid, when recombinantly CC expressed in enteric bacteria (which are nontoxigenic and nonpathogenic), is suitable for use in the in vivo sequestration and elimination of CC mercuric ion from gastrointestinal tracts of animals or humans exposed to toxic metal ions such as mercury and/or cadmium. The molecules of the invention are also useful in water treatment resins. The nucleic acid of the invention is highly specific and binds divalent cation such as CC mercury or cadmium with high affinity. The present amino acid sequence cadmium/mercury ion binding chelon proteins of the invention. This sequence is one of the heavy metal binding proteins termed chelons of the convention.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Score
